understand how to use the different binding options for multiple sections in a single viewmodel. I have an array of element object containing multiple sections of information and i want to display them all on one page, but I need to have an indicator showing if a section is currently being displayed. How would I go about binding this? What is the best way to create a view model that can display multiple sections from an array? I'm using C# MVC, but could be using either server side or javascript

A: You need to use a nested foreach loop. I wouldn't use a view model for this, since there's really no need to create a new type of object. Just put the data into an array and the view model can be used directly from the array. 82157476af
